OnePlus Confirms up to 40,000 Customers were Impacted by Credit Card Hack

If you gave your credit card number to OnePlus sometime between mid-November and last week, your card may have been comprised. The smartphone maker confirmed this morning through its online forum that upwards of 40,000 customers may have had their numbers exposed to hackers. OnePlus has sent out emails to users it believes may have been impacted after a malicious code was inserted into the company's payment page, designed to sniff out credit card numbers. "The malicious script operated intermittently, capturing and sending data directly from the user's browser. It has since been eliminated," a spokesperson wrote in the forum post. The company adds that it's since taken action, by quarantining the affected server and putting additional safeguards in place. The company disabled credit card transactions a few days back, after customers began noticing fraudulent charges on their account. It did, however, continue payments made through Paypal, which appear to not have been impacted by the hack. Customers using a card number entered prior to the aforementioned timeline also appear not to have been impacted by all of this.
