## **Researchers Find Critical Security Flaws in Popular Car Models**

Modern-day vehicles have become overly digitized for the sake of offering advanced technicality to drivers. However, being digital cannot ensure optimal security and the same has been the case with smart cars. Security researchers Daan Keuper and Thijs Alkemade from Computest claim that some of the car models manufactured by Audi and Volkswagen contain a flaw that can be exploited by attackers easily over the internet.

The problem is that Volkswagen doesn't want to patch the flaw claiming that the models are not equipped with updating over-the-air capability.
