## **Company Says Its Software Allows Anyone to Hack into an iPhone**

A company called DriveSavers, which is specialized in data recovery services, promises that anyone can hack into an iPhone, even if it's protected with a super-long passcode. "Utilizing new technology, we have a 100% success rate with unlocking and recovering data from passcode-protected smartphones of every make, model and operating system with any length passcode, including phones and tablets with more complicated passcodes of six digits or more," it says. DriveSavers says it won't unlock an iPhone that does not belong to you, and it is, in fact, running a detailed check to make sure that you have the right to access the data stored on the device. "We attempt to validate the legal right to access the data during all phases of the recovery process. This starts with the information gathered during the intake process. We also have a legal authorization form requiring specific information identifying the right to the data," it explains. Apple hasn't provided any statement on this new iPhone hacking method, and right now nobody can tell if the success rate is indeed 100 percent. On the other hand, there's a chance that Apple is already looking into reports and searching for potential exploits in its code, so don't be too surprised if a patch is issued in a future iOS update. DriveSavers says it can hack into other devices as well, including Android phones made by Samsung, BlackBerry, and Windows PCs.
